## Introduction

Analog rice or artificial rice is a non-paddy's rice made from other carbohydrate sources, with the carbohydrate content is close to or more than rice and it has rice-like shape. Cassava is used as an alternative of rice because it is one among the tubers that have the highest carbohydrate value. The high value of carbohydrates is not supported by other substances, especially protein content, so when producing the analog rice, this product is expected to have protein values close to rice from paddy, and could be better

## Materials and Methods

The method used in this research is to compare the proximate analysis data from cassava analog rice with red bean paste with rice standard according to Budijanto and Muaris (2013)

## Result and Discussion

Analyst	Unit	Cassava Artificial Rice with The Additional of Red Bean Paste						
		Rice	0%	20%	40%	60%	80%	100%
Water level value	%	12,88	8,39	8,90	9,04	10,08	10,10	11,30
Dust level value	%	0,19	0,63	0,96	1,38	1,42	1,65	1,82
Protein level value	%	7,39	10,20	10,93	11,90	14,38	16,86	26,28
Fat level value	%	0,19	3,02	3,63	3,65	3,19	3,88	4,04
Carbohy drate level value	%	79,64	77,76	75,58	74,03	70,93	67,51	56,56

## Conclusion

Based on the research that has been done, the selected treatment is the making of cassava analog rice with the addition of red bean paste 20%. This treatment is selected based on carbohydrate and protein values. The proximate value is: water content 8.90%, ash 0.96%, protein content 10.93%, fat content 3.63% and carbohydrate content 75.58%.
