ABSTRACT

INTERNATIONAL CONFERENCE ON BIODIVERSITY

SOCIETY FOR INDONESIAN BIODIVERSITY

Surakarta, 27 August 2022

THEME:

Coastal Area Management for Sustainable Use of Marine Resources

SECRETARIAT ADDRESS

Sekretariat Masyarakat Biodiversitas Indonesia, Kantor Jurnal Biodiversitas, Gedung Pascasarjana Lt. 5 Universitas
Sebelas Maret Surakarta, Jl. Ir. Sutami 36A Surakarta 57126, Jawa Tengah, Indonesia. Tel. +62-822 2649 8910. Email:
biodiversitas@gmail.com. Website: <https://events.smujo.id/e/international-conference-202208/>

TIME SCHEDULE

International Conference on Biodiversity

Society for Indonesian Biodiversity (SIB)

Surakarta, Indonesia, 27 August 2022

TIME	ACTIVITIES	PERSON IN CHARGE	SITE
Time in Jakarta, Indonesia			
August 27, 2022			
07.30-08.00	Registration	Committee	Lobby
08.00-08.30	Opening ceremony	Committee	Main Room
	- Indonesian National Anthem		
	- Pray		
	- Message from SIB		
	(Prof. Drs. Sutarno, M.Sc., Ph.D)		
08.30-09.15	Panel I	Moderator:	Main Room
	Prof. Dr. Chee Kong Yap	Sugeng Budiharta, Ph.D.	
	(Universiti Putra Malaysia, Malaysia)		
09.15-10.00	Panel II		
	Associate Professor Jeff Ross		
	(University of Tasmania)		
10.00-11.30	Parallel presentation		
	Group 1: A-01 to B-02	Moderator: Dr. Joko R. Witono	R1
	Group 2: B-03 to B-09	Moderator: Prof. Dwi Astiani	R2
	Group 3: B-10 to B-16	Moderator: Dr. Praptiwi	R3
	Group 4: B-17 to C-04	Moderator: Dr. P.K. Dewi Hayati	R4
	Group 5: C-05 to D-03	Moderator: Dr. Arida Susilowati	R5
	Group 6: D-04 to E-06	Moderator: Yosep S. Mau, Ph.D	R6
	Group 7: E-07 to E-14	Moderator: Prof. Novri Nelly	R7
11.30-11.45	Announcement and Closing	Committee	Main Room

Note: A. Genetic Diversity, B. Diversity of Species, C. Diversity of Ecosystem, D. Ethnobiology and Socioeconomics, E. Bioscience (Life Science and Technology); O. Oral.

TABLE OF CONTENTS

International Conference on Biodiversity

Society for Indonesian Biodiversity (SIB)

Surakarta, Indonesia, 27 August 2022

CODE	TITLE	AUTHOR(S)	PAGES
Genetic diversity			
A-01	Variability of morpho-dichotomous identification with DNA barcoding of <i>Aegiceras</i> sp. in Glan Sarangani Province Philippines	Leegie A. Mañoza, Marigold Tumamac, Christian Enriquez, Joan Fetalvero, John Philip Naval, John Clark Patayon, Arman Lozaga, Julius Mingoc, Donna Ria Josue Canacan	26
A-02	Variability of morpho-dichotomous identification with dna barcoding of grey mangrove (<i>Avicennia marina</i> (Forsk.) Vierh.) in Sarangani Bay Protected Seascape, Philippines	Joan Fetalvero, Marigold Tumamac, Ace Belarma, Leegie Mañoza, Christian Enriquez, Julius Mingoc, Donna Ria-Josue Canacan	26
A-03	Genetic diversity of local rice accessions from Jambi, Indonesia based on seedling morphological characters	Aditya Wahyudhi, Febrina Herawani, Muhammad Tirto, Andita Minda Mora, Noni Rahmawati, Aidiah	27
A-04	Variability of morpho-dichotomous identification with dna barcoding of mangrove apple (<i>Sonneratia alba</i>) in Glan, Sarangani Province, Philippines	Christian B. Enriquez Marigold C. Tumamac Leegie A. Mañoza Joan C. Fetalvero Philip John F. Naval John Clark Y. Patayon Arman C. Lozaga Julius V. Mingoc Donna Ria Josue-Canacan	27
A-05	Molecular characteristics and evolutionary relationships of Toll-Like Receptor (TLR)21 in Indonesian local chicken (Kampung Unggul Balitbangtan (KUB)-1)	Raden Rara Bhintarti Suryohastari, Sony Heru Sumarsono, Ernawati Arifin Giri-Rachman	27
Diversity of Species			
B-01	The distribution, habitat characteristic, and management of seahorses (<i>Hippocampus</i> spp.) in Indonesia	Masayu Rahmia Anwar Putri, Astri Suryandari	28
B-02	Superior varieties of Indonesian grapes and promise import substitution	Emi Budiwati	28

D-05	Wild edible plants in four Agni tribes of Central-east and Northeast of Côte d'Ivoire: A comparative study	Djah François Malan, Amani Léopold Litta, Ménéké Distel Kougbo, Amadou Lamine Diop, Kouassi Gérard Kouassi	39
Bioscience			
E-01	Traditional fisheries management in conflict zones based on the blue economy concept	Endang Bidayani, Reniati Reniati, Agung Priyambada	40
E-02	Selection index for superior high yielding rice lines (<i>Oryza sativa</i> L.) well adapted to an-aerobic saline prone area	Nafisah, Trias Sitaresmi, Ali Imamuddin, Aris Hairmansis	40
E-03	Isolation and characterization of halophilic bacteria for hydrolytic enzyme production	Indrayani Indrayani, Reski Praja Putra, Amiruddin Hambali, Ardiansyah	40
E-04	The watershed land conservation formulation using ecological resilience and social resilience : A case study	Bambang Sudarmanto, Suranto, Suntoro, Joko Sutrisno	41
E-05	How earthworm and fungi can help in enhancing agro-economics and food security	Sadashiv Chaturvedi, Mansi Negi	41
E-06	Panama disease of banana: Learning from the <i>Fusarium oxysporum</i> -tomato interaction	Sri Widinugraheni, H. C. van der Does, P. van Dam, M. Rep	41
E-07	Inventory of mangrove species on Sempu Island and their potential as phytoremediation of heavy metals	Alfin Fatwa M. Afifudin, Rony Irawanto, Hari Purnomo	42
E-08	Characterization of seed collected from wetland – riparian in the downstream of Brantas River, East Java, Indonesia	Rony Irawanto, Melisnawati H. Angio, Elga Renjana, Linda Wige Ningrum, Elok Rifqi Firdiana, Dian Latifah	42
E-09	The effect of AMF indigenous applications on soil nutrients and plant nutrition two shallots varieties in drought stress conditions	Eka Susila N, Fri Maulina, Aswaldi Anwar, Auzar Syarif, Agustian	42
E-10	Application <i>Azotobacter</i> dan <i>Pseudomonas fluorescens</i> bacteria indigenous to improve plant rice production SRI method	Nelson Elita, Eka Susila N, Agustamar	43
E-11	A multivariate morphometric analysis to delineate stock structure of Kawakawa <i>Euthynnus affinis</i> (Cantor, 1849) from Malaysia and Yemeni waters	Khaled Binashikhbubkr, Darlina Md. Naim	43
E-12	Variability, heritability and response of West Sumatran upland rice cultivars to shade conditions	P. K. Dewi Hayati, Agung Primatara Marwan, Arief Munandar, Sutoyo, Aswaldi Anwar	44
E-13	Utilization of entomopathogen fungi <i>Beauveria bassiana</i> (Bals). Vuil for control of <i>Spodoptera frugiperda</i> J.E. Smith (Lepidoptera: Noctuidae)	Novri Nelly, Reflinaldon, Suci Reno Meriqorina	44
E-14	Shrinking and shifting of predicted suitable habitat of indigenous cryptogams, <i>Selaginella willdenowii</i> and <i>S. intermedia</i> , in Southeast Asia under climate change	Ahmad Dwi Setyawan, Suranto, Sutarno, Sugiyarto, Sunarto, Ilyas Nursamsi, Sugeng Budiharta, Jatna Supriatna, Prakash Pradan	44

Note: A. Genetic Diversity, B. Diversity of Species, C. Diversity of Ecosystem, D. Ethnobiology and Socioeconomics, E. Bioscience (Life Science and Technology); O. Oral.

Our result showed that the I-3 resistant plants infected by Fol Δ SIX1::SIX1a/b/c have lower diseased index and higher weight compare to the plants infected with Fol Δ SIX1. In contrast, susceptible tomato plant have higher disease index and lower weight when infected with these transformants in comparison to Fol Δ SIX1. The Fol Δ SIX1::GFP transformants gave high disease score and low weight both in the I-3 and the susceptible tomato plants. This result suggests that SIX1a/b/c may have been interact with the I-3 resistance gene, and therefore induce immune response. However, we also saw that in the Fol Δ SIX1::SIX1a/b/c strains have reduced in pathogenicity compare to the Fol wild type as well as Fol Δ SIX1::FolSIX1 strain. We assume that the ectopically inserted gene may have caused the gene to be less expressed in these transformants.

Banana, *Fusarium*, interaction, panama disease

Inventory of mangrove species on Sempu Island and their potential as phytoremediation of heavy metals

Alfin Fatwa M. Afifudin¹, Rony Irawanto², Hari Purnomo³

¹Department Biology, Faculty of Science and Technology, UIN Sunan Ampel Surabaya. Jl. Ahmad Yani No.117, Jemur Wonosari, Wonocolo, Surabaya 60237, East Java, Indonesia

²Research Center of Ecology and Ethnobiology, National Research and Innovation Agency (BRIN). Jl. Raya Surabaya - Malang No.Km. 65, Sembung Lor, Parerejo, Pasuruan 67163, East Java, Indonesia

³Center for Natural Resources Conservation (BBKSDA) East Java. Jl. Raya Bandara Juanda, Dukuh, Sedati Agung, Sedati, Sidoarjo 61253, East Java, Indonesia

One of the nature reserves in Indonesia is the Sempu Island Nature Reserve (CAPS) in East Java. The government set the Nature Reserve status due to its rich and unique natural features and biodiversity, which is priceless for research and science. For example, there are many types of native Indonesian plants on the island, one of which is mangroves. One of the ecological functions of mangrove plants is as a habitat for marine organisms, breakwaters, and also as a reducer of water pollution or phytoremediator. This study is an exploratory study that aims to determine the diversity of mangrove species found on Sempu Island and explore its potential as a phytoremediation of heavy metals with a literature review method. Exploration was carried out in July 2022 on three beaches on Sempu Island, namely Teluk Semut, Teluk Ra'as, and the Freshwater area. The results showed that eight types of mangroves found on Sempu Island, which were *Rhizophora apiculata*, *Rhizophora mucronata*, *Rhizophora Stilosa*, *Ceriops decandra*, *Aegiceras corniculatum*, *Excoecaria agallocha*, and *Heritiera littoralis*. The highest diversity of mangrove species was found in Teluk Semut, then Teluk Ra'as, and the lowest in the Freshwater area. Furthermore, all mangrove species are discovered to have the potential to reduce heavy metals such as copper (Cu), mercury (Hg),

lead (Pb), zinc (Zn), iron (Fe), and several other heavy metals.

Characterization of seed collected from wetland – riparian in the downstream of Brantas River, East Java, Indonesia

Rony Irawanto, Melisnawati H. Angio, Elga Renjana, Linda Wige Ningrum, Elok Rifqi Firdiana, Dian Latifah

Research Center of Ecology and Ethnobiology, National Research and Innovation Agency (BRIN). Jl. Raya Surabaya - Malang No.Km. 65, Sembung Lor, Parerejo, Pasuruan 67163, East Java, Indonesia

Extraordinarily high biodiversity in Indonesia in some cases depends on wetland, riparian and aquatic areas, especially in watersheds. One of the important watershed for the people of East Java is the Brantas River Basin. Unfortunately, its sustainability and biodiversity is threatened by area degradation and increasing river pollution thus the inventory and documentation of its plant diversity is important. One of the conservation efforts conducted by Purwodadi Botanic Garden - LIPI was the exploration and collection of seeds of plant species along downstream of the Brantas River Basin, East Java. This study used survey method from 17 to 28 November 2020 and to determine which plants to harvest, seeds cut-test was implemented. The fruits were extracted and the seeds obtained were dried and their moisture contents were determined using desiccation method. Out of 15 species obtained, most of them have orthodox seeds such as *Acacia farnesiana*, *Acanthus ilicifolius*, *Coix lacryma-jobi*, *Crotalaria juncea*, *Cyathula prostrata*, *Dolichandrone spathacea*, *Ipomoea carnea*, *Lannea coromandelica*, *Neptunia plena*, *Ruellia tuberosa*, *Senna hirsuta*, *Senna* sp., *Sonneratia caseolaris* and *Thespesia populnea*, and only one of them, *Sesuvium portulacastrum*, has recalcitrant seed.

⁴Soil Biology Laboratory, Faculty of Agriculture, Universitas Andalas. Limau Manis, Pauh, Padang 25175, West Sumatra, Indonesia

One of the limiting conditions for shallot plants to grow optimally is acid dry land conditions. Indigenous Arbuscular Mycorrhizal Fungi (AMF) application is one way to overcome this condition. This study aimed to determine the effect of indigenous AMF application on soil nutrients and plant nutrients of two shallot varieties which are sensitive and tolerant to drought stress conditions. The study was carried out for 6 months on a wire house and laboratory scale. Experiment using a completely randomized design with two factors. The first factor is the Brebes (Sensitive) and Kuning (Tolerant) varieties of shallots. The second factor is the application of indigenous AMF which consists of 5 levels, namely 3 levels are given singly; *Glomus* sp1, *Glomus* sp2, *Glomus* sp3, one level is a mixed isolate and as a control treatment without applications of AMF. Observation parameters include chemical analysis of the soil media and uptake of N, P and K plants. From the observations, it can be concluded that there is no difference in nutrient uptake and plant nutrients between sensitive and tolerant varieties under drought stress conditions. Sensitive varieties adapt with the help of AMF hyphae, while tolerant varieties with the ability to adapt to dry land by multiplying roots so that they have the same ability to absorb nutrients. Application of mixed isolates of indigenous AMF (*Glomus* sp1+*Glomus* sp2+*Glomus* sp3) showed a decrease in the availability of nutrients (N, P and K) in the media, on the contrary there was an increase in nutrients (N, P and K) in plants.

Application *Azotobacter* dan *Pseudomonas fluorescens* bacteria indigenous to improve plant rice production SRI method

Nelson Elita^{1,✉}, Eka Susila N², Agustamar²

¹Department of Food Crop Cultivation, Politeknik Pertanian Negeri Payakumbuh. Jl. Raya Negara Jl. Tj. Pati No.KM. 7, Koto Tuo, Harau, Lima Puluh Kota 26271, West Sumatra, Indonesia

²Master Program in Applied Food Security, Politeknik Pertanian Negeri Payakumbuh. Jl. Raya Negara Jl. Tj. Pati No.KM. 7, Koto Tuo, Harau, Lima Puluh Kota 26271, West Sumatra, Indonesia

The intensification of rice fields have been dominated by high artificial fertilizers, especially N and P. Nitrogen and phosphate as essential macronutrients, have an important role in increasing rice production. N and P malnutrition can be a limiting factor in increasing rice production. The problem of N elements in wetlands is relatively short availability, easily dissolved in water, carried by percolation, surface flow and volatile. The efficiency of N fertilizer uptake in the tropics by lowland rice crops is relatively low at around 30-50%. The problem of the availability of P elements is low, only 15-20% unusable P

which can be absorbed by the plant, so that the structure of the soil becomes solid, and the soil organic matter content decreases. The high P residue causes the land to become a criterion. Effective and efficient solutions are needed namely a biological approach by utilizing the rhizobacteria group on the problem at hand. The existence of indigenous rhizobacteria is very diverse in the soil. This is influenced by biotic and abiotic factors in the soil. The type of rhizobacteria expected to be able to increase the availability of special nutrient elements N is the indigenous native species, namely *Azotobacter*. The type of rhizobacteria that can mine P elements that are not available to be available is a type of local phosphate solvent bacteria, *Pseudomonas fluorescens* indigenous. Both types of indigenous rhizobacteria were applied to the SRI method of rice. The aim of this study was to determine the *Azotobacter* bacteria and *Pseudomonas fluorescens* can be combined and determine the dose of *Azotobacter* bacteria and the appropriate dose of *Pseudomonas fluorescens* bacteria can increase the production of SRI rice plants. The research was carried out in vitro in TSA medium and in a greenhouse. The results showed no inhibitory power between *Azotobacter* bacteria and *Pseudomonas fluorescens*. Application in the greenhouse showed that at a dose of 20 ml/l *Azotobacter* and a dose of 30 ml/l *Pseudomonas fluorescens* gave the highest vegetative growth and production in the SRI method. Conclusion *Azotobacter* bacteria and *Pseudomonas fluorescens* can be combined in one formulation. The best *Azotobacter* dose of 20 ml/l and *Pseudomonas fluorescens* bacteria 30 ml/l.

Azotobacter, indigenous, *Pseudomonas fluorescens*, rhizobacteria, SRI

A multivariate morphometric analysis to delineate stock structure of Kawakawa *Euthynnus affinis* (Cantor, 1849) from Malaysia and Yemeni waters

Khaled Binashikhbubkr^{1,2,✉}, Darlina Md. Naim¹

¹School of Biological Sciences, Universiti Sains Malaysia. 11800 Pulau Pinang, Malaysia

²Department of Biology, Faculty of Science, Hadhramout University. Mukalla, Yemen

Euthynnus affinis is a little migratory neritic epipelagic tuna and become one of the most critical commercial tuna species in Indo-Pacific's tropical and subtropical waters. Unfortunately, nothing is known about the species' local management practices or stock structure. Therefore, an evaluation of stock structure based on morphometric information is crucial for the effective and successful management of the species. The aim of this study was to investigate the body shape variations among twenty populations of *E. affinis* utilizing principal component analyses (PCA), discriminant function analyses (DFA), and cluster analysis (CA). In total, 416 individuals of *E. affinis* were collected from five main geographic areas, namely Straits of Malacca (M), South China Sea (SCS), Sulu Sea
